Videox User Guide *professional edition*

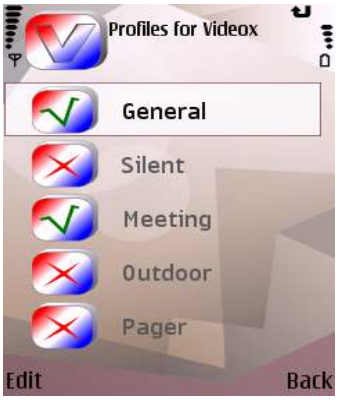
Videox is a software service which is able to play video or show image files for the incoming calls.

In the main menu, use the **Options->Select** command to edit and configure the selected option.

- **Profiles (for Videox)**.

This option will show you a list with the profiles available from your phone. Each profile-item in list is specific for the **Videox** software. It allows you to configure additional settings for the equivalent built-in profile name so that the **Videox** service can play video or show image files for the incoming calls.

To edit a **Videox** profile, press the joystick or use the **Edit** command option. In the shown settings list you can configure the selected **Videox** profile:



- **Status.** If set on **Enabled,** the **Videox** profile is active and will react for the incoming calls only if its equivalent built-in phone profile name is active. If the built-in equivalent phone profile name is not active the **Videox** profile will not react (even it is set on **Enabled)**. If set on **Disabled,** the **Videox** profile will not react and the built-in phone active profile will take place on incoming calls as normally.
- **Incoming call action.** Select **Play video** to play a video file. Select **Show image** to show an image.
- **Select video.** Allows you to select the video file to be played for the incoming calls. Available if **Incoming call action** is set on **Play video**.
- **Select image.** Allows you to select the image file to be shown for the incoming calls. Available if **Incoming call action** is set on **Show image**.
- **Select ringtone.** Allows you to select the audio ringing tone to be played when there is an incoming call. Available if **Incoming call action** is set on **Show image**.
- **Show mode.** If set on **Large (full-screen)**, the video or image will be scalled to the maximum screen area available for play. If set on **Small (top-screen)** the image or video will be shown in the top area of the screen with a smaller size.
- **Sound volume (%).** Allows you to set the audio volume of the video or ringing tone played for the incoming call. To achieve the silent mode (mute) set the volume to 0% (Silent).
- **Skin color.** The color of the **Videox** player interface can be set with this option.

The **Videox** profile settings can be tested using the command **Options->Test it.** Use the **Options->Save** command to save the settings. Press **Cancel** to discard the changes.

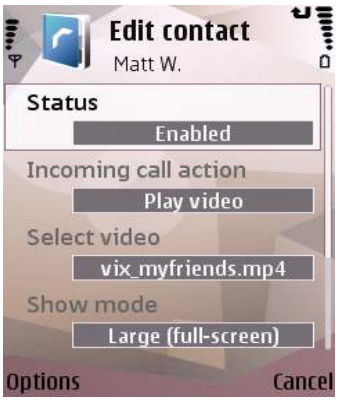
- **Contacts (for Videox).**

This option will show the built-in phone **Contacts** list. For each contact you can define additional settings so that the **Videox** service will be able to play different video or image files for different contacts. You can set also different skin colors for contacts.

When the contacts list is shown, select the desired contact and press the joystick or use the **Edit** command to edit the **Videox** settings for the selected contact.

The settings for contacts are similar like for the **Videox** profiles as described above.

The **Videox** contact's settings can be tested using the command **Options->Test it.** Use the **Options->Save** command to save the contact's settings. Press **Cancel** to discard the changes.



- **Settings (for Videox).**

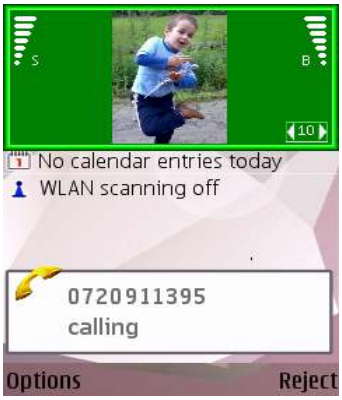
Allows you to configure general settings for the **Videox** service:

- **Show caller name.** Caller's name can be shown as **First,Last Name** or viceversa using this setting.
- **Show indicators.** If set on **Yes**, the battery, signal-strength and volume indicators will be shown in the player interface.
- **Video splash intro.** If set on **Yes,** a video is played when the **Videox** software is started.

- **Videox player interface.**

When there is an incoming call, **Videox** will display a specific graphical window where the video or the image is played/shown. It will also show the remote caller's name, telephone number and the softkey commands **Answer, Reject, Silent.** To answer a call press the **GREEN** key or use the **Answer** command. To reject a call press the **RED** key or use the **Reject** command. Press the **Silent** command to acheive the silence mode (mute). To change the audio ringing volume press the joystick left-right.

Note that, when the phone rings and the **Videox** is enabled/playing, the softkeys left-right are owned by the **Videox** and not by the phone built-in application. The softkeys implements at least the **Answer, Reject and Silent** commands.



Notes:

- **Note 1: Videox** will automatically adjust some of the built-in phone **Profiles** settings so that it will be able to play video or show images for incoming calls. The changes are restored back if the **Videox** profile is disabled or the **Videox** software is uninstalled. You can also use the phone built-in **Profiles** application to change the settings back to your values. In this case the **Videox** settings will be disabled.
- **Note 2:** You can use any video, image or audio file which is supported by your phone. However, it is recommended to test the settings for the **Videox** profiles or contacts with the command **Test it**. Some video,audio or image files and/or formats can not be played due to the digital rights management or other reasons, eg. files too big/large.
- **Note 3:** The contacts uses the sound volume value set in the **Videox** profile, even this is disabled.
- **Note 4:** The contacts can be played even all the **Videox** profiles are disabled.
- **Note 5:** Vibra is supported and it can be set on/off using the normal built-in phone **Profiles** application.
- **Note 6**: Small screen size phones like Nokia 5500 or 3250 do not show the player's borders when playing videos in full-screen/large mode. This is due to low screen resolution and to save display space for the played video.

- **Built-in videoringtones.**

Videox comes with 3 nice videos included in the installation package. (mp4 format) You can use these videos as videoringtones for your **Videox** profiles or contacts. Below are some captures.
